

# Synthesizing Results from Multiple Exoplanet Detection Techniques

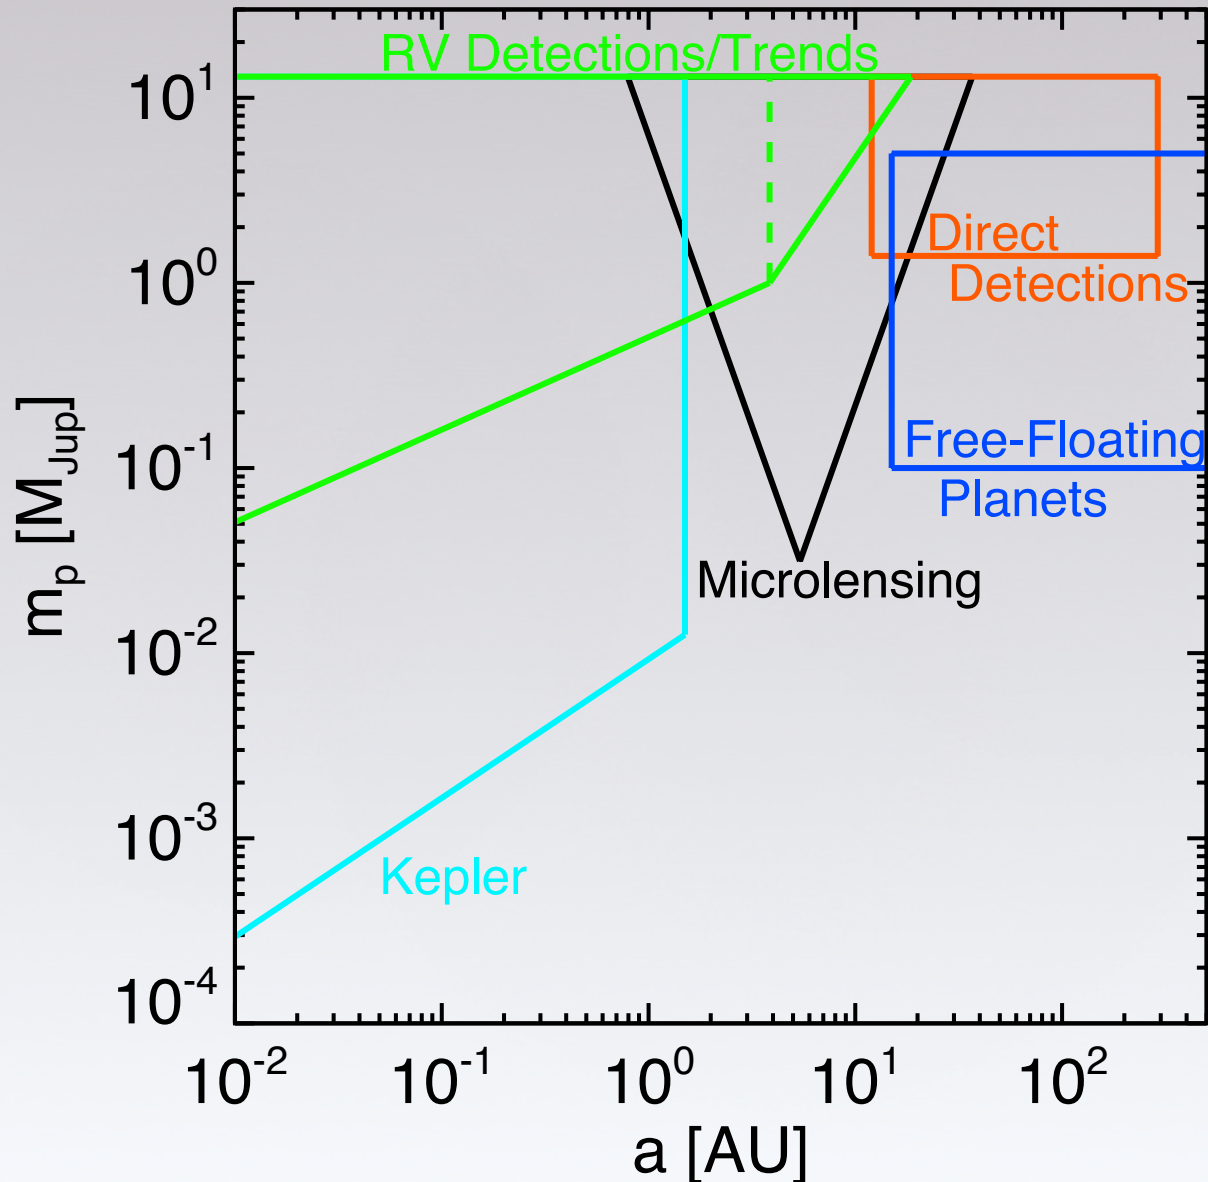

{ The Demographics of  
Planets Orbiting M Dwarfs

Christian Clanton  
19<sup>th</sup> Annual Microlensing Meeting  
20 January 2015

# M Dwarfs

- ⌘ Common
- ⌘ Most well-characterized stellar population in terms of exoplanet demographics
- ⌘ Existing constraints from several observational techniques

# Sensitivity of Various Methods

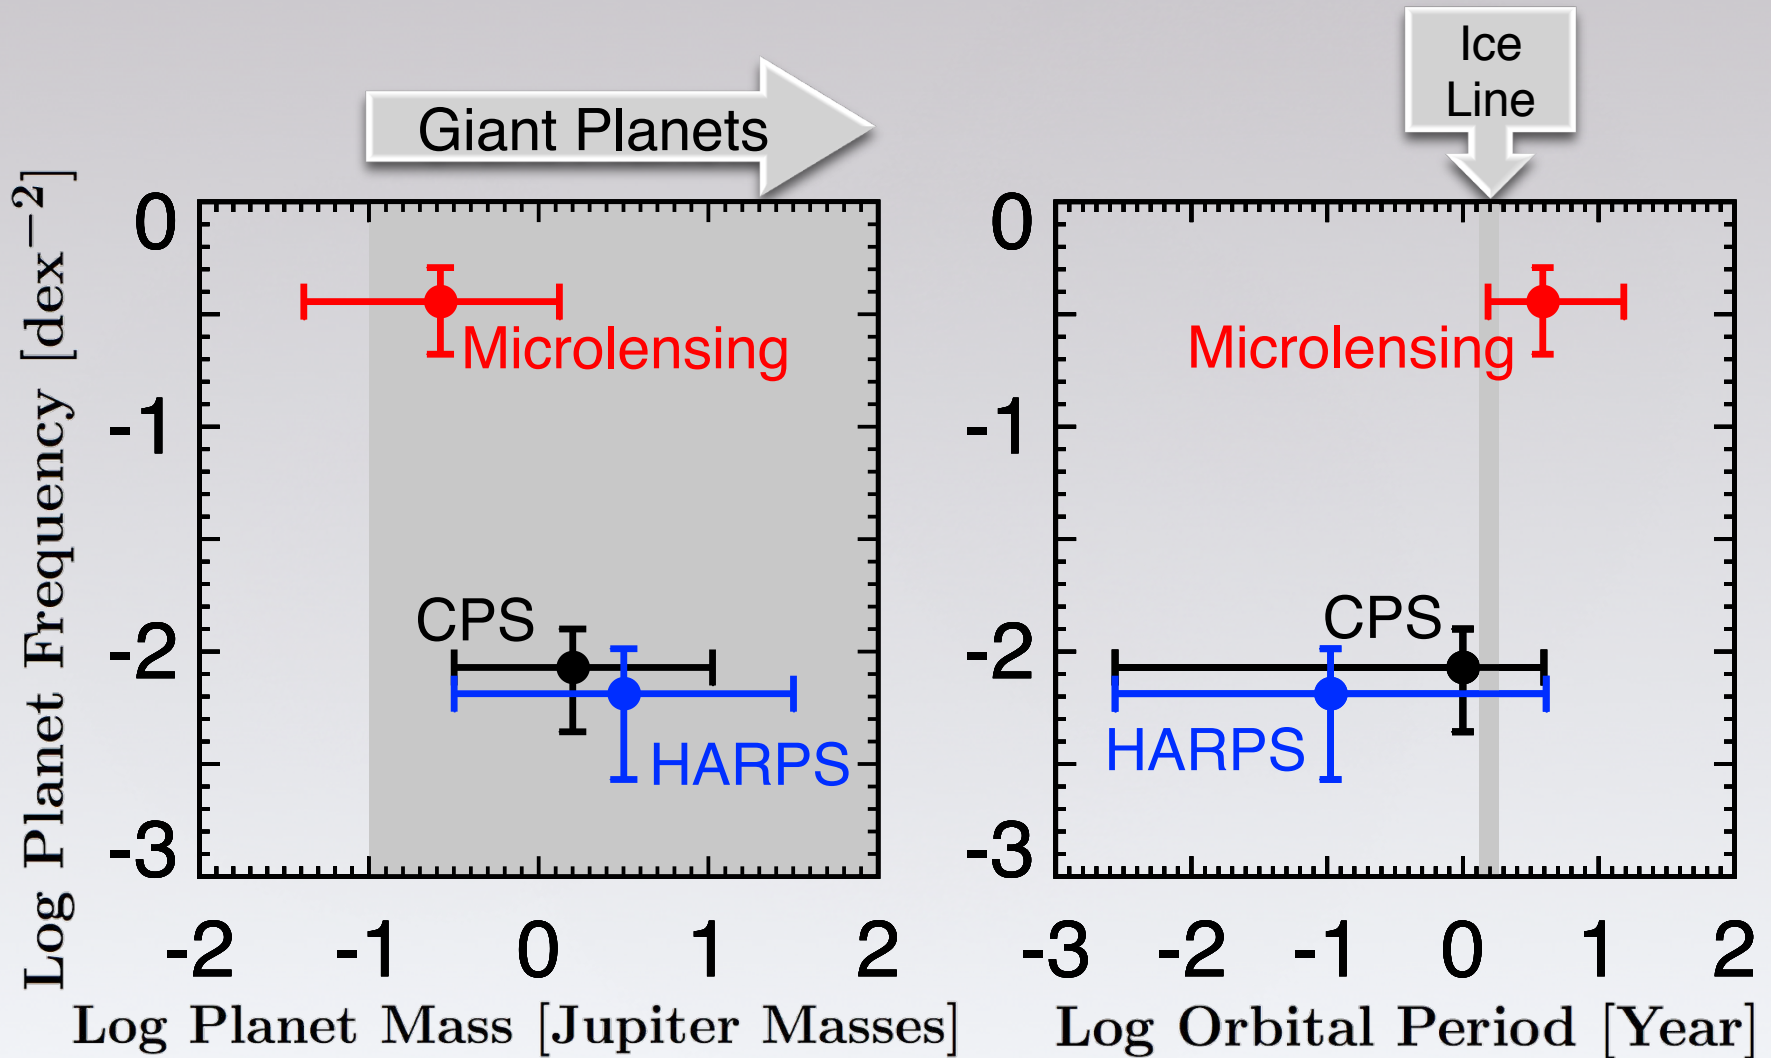

# Comprehensive Picture of Exoplanet Demographics

---

& Combine results from these  
various techniques

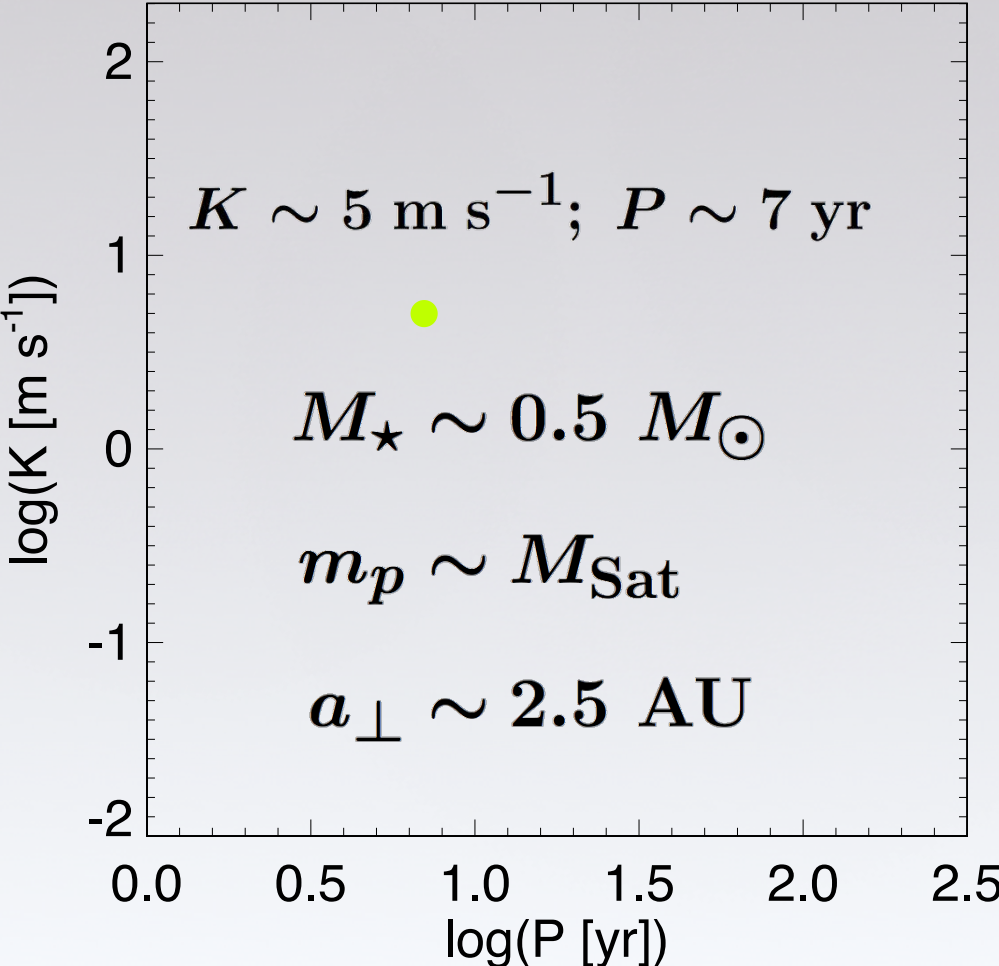

∅ Clanton & Gaudi (2014ab)

# Tension Between RV and Microlensing Results

CPS: Johnson+ 2010; Montet+ 2013  
HARPS: Bonfils+ 2013  
Microlensing: Gould+ 2010

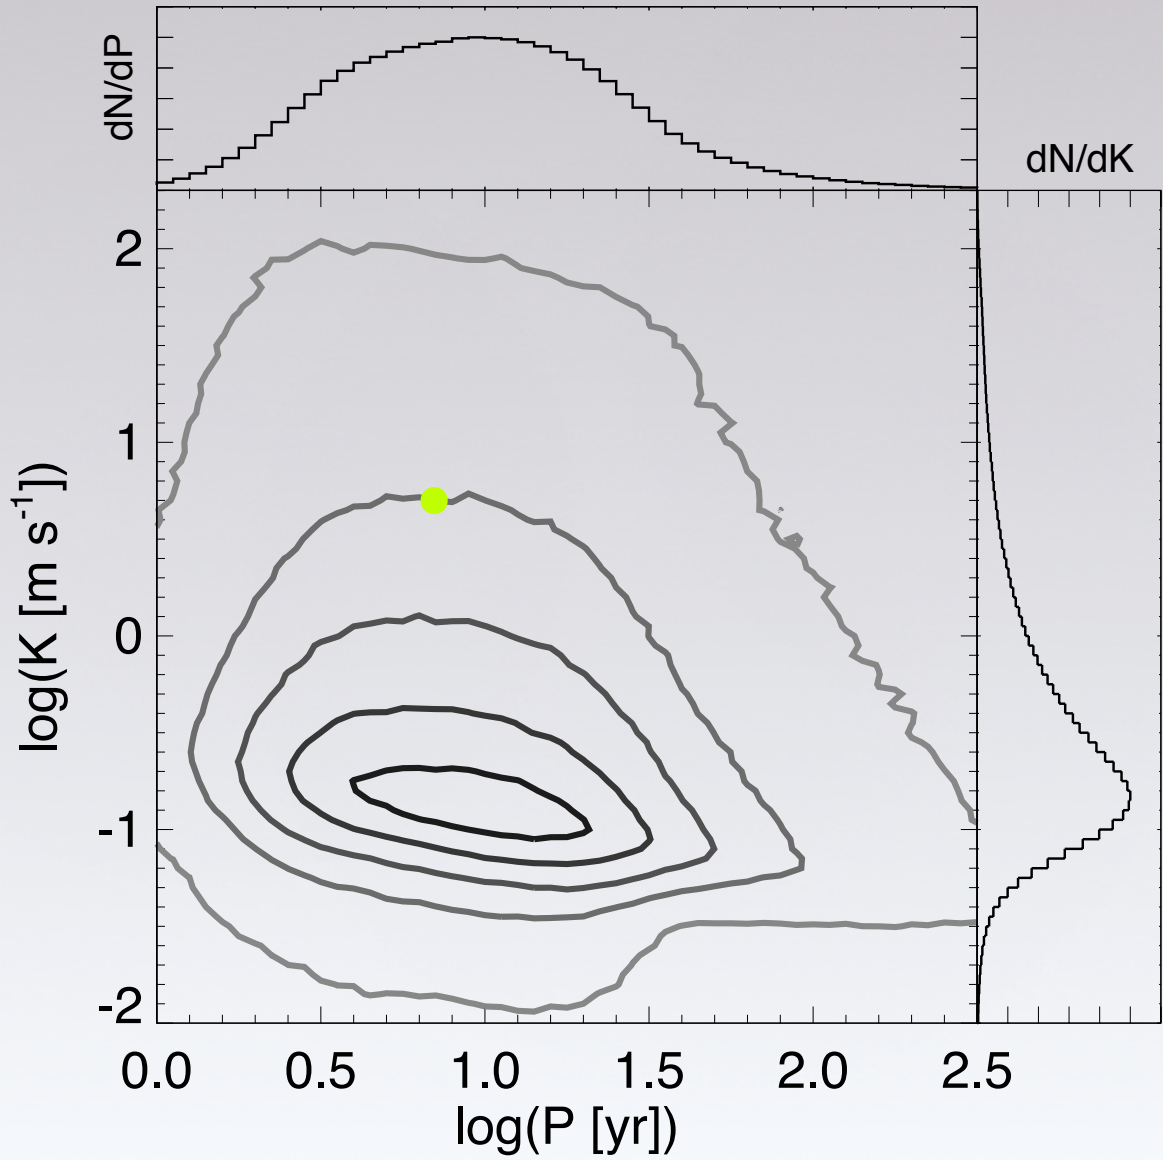

# Mapping of “Microlensing Planets” into RV Observables

Upper Limit
Lower Limit
Upper and Lower Limits

# Microlensing + RV Results

- ⌘ Steep mass function primarily responsible for perceived difference
- ⌘ 2 planets per star ( $1-10^4 M_{\oplus}$ ;  $1-10^4$  days)
- ⌘ 0.15 giant planets per star ( $30-10^4 M_{\oplus}$ ;  $1-10^4$  days)
- ⌘ 0.03 Jupiters/Super-Jupiters per star ( $1-13 M_{\text{jup}}$ ;  $1-10^4$  days)

# Constraints on Long-Period, Giant Planets and Free-Floating Planets

## Microlensing Surveys

Gould+ (2010)  
Sumi+ (2010)  
Sumi+ (2011)

## Radial Velocity Surveys

Montet+ (2014)

## Direct Imaging Surveys

Bowler+ (2014)  
Lafreniere+ (2007)

$$\{\alpha, \beta, \mathcal{A}, a_{\text{out}}\}$$

$$\frac{d^2 N_{\text{pl}}}{d \log m_p d \log a} = \mathcal{A} \left( \frac{m_p}{M_{\text{Sat}}} \right)^\alpha \left( \frac{a}{2.5 \text{ AU}} \right)^\beta$$

$$\mathcal{F} = \int_{\log(0.1 \text{ AU})}^{\log(a_{\text{out}})} \int_{\log(1 M_\oplus)}^{\log(13 M_{\text{Jup}})} \frac{d^2 N_{\text{pl}}}{d \log m_p d \log a} d \log m_p d \log a$$

Lafreniere+ (2007)

# Preliminary Results + Work in Progress

⌘ Class of models consistent with all surveys

⌘ Also consistent with the interpretation of the overabundance of short timescale events identified by Sumi+ (2011) as a bound population

⌘ Full Simulations to come!
